Lithium-ion batteries use lithium ions to create an electrical potential between the positive and negative sides of the battery, known as the electrodes. A thin layer of insulating material called a "separator" sits between the two electrodes and allows the lithium ions to pass through while blocking the electrons.

Types of Lithium-ion Batteries. Lithium-ion uses a cathode (positive electrode), an anode (negative electrode) and electrolyte as conductor. (The anode of a discharging battery is negative and the cathode positive (see BU-104b: Battery Building Blocks). The cathode is metal oxide and the anode consists of porous carbon.

Lithium-ion batteries are the state-of-the-art electrochemical energy storage technology for mobile electronic devices and electric vehicles. Accordingly, they have attracted a continuously increasing interest in academia and industry, which has led to a steady improvement in energy and power density, while the costs have decreased at even faster pace.

**BOSCH-EXCLUSIVE COOLPACK 2.0 TECHNOLOGY** : Cools the battery and helps provide longer battery lifetime compared to non-CoolPack Bosch 18V batteries **COMPACT OPERATION**: Weighs only 1.10 Lbs. but provides power for standard to medium-duty applications, such as drilling into concrete, metal and wood; metal grinding; cutting and even light-duty chipping

The idea of Lithium Ion battery was first coined by G.N Lewis in the 1912, but it became feasible only in the year 1970's and the first non-rechargeable lithium battery was put into commercial markets. Later in 1980's engineers attempted to make the first rechargeable battery using lithium as the anode material and were partially successful.
