What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Why do we need energy storage technologies?

The development of energy storage technologies is crucial for addressing the volatility of RE generation and promoting the transformation of the power system.

Do market-based storage technologies compete with electricity prices?

All market-based storage technologies have to prove their performance in the large electricity markets or if applied decentralized, the (battery) systems compete with the electricity prices at the final customers level when the battery costs are also taken into consideration.

What role does energy storage play in the transport sector?

In the transport sector, the increasing electrification of road transport through plug-in hybrids and, most importantly, battery electric vehicles leads to a massive rise in battery demand. Energy storage, in particular battery energy storage, is projected to play an increasingly important role in the electricity sector.

Which energy storage technologies offer a higher energy storage capacity?

Some key observations include: Energy Storage Capacity: Sensible heat storage and high-temperature TES systems generally offer higher energy storage capacities compared to latent heat-based storage and thermochemical-based energy storage technologies.

Do electricity storage systems have economic perspectives?

The major result is that the perspectives of electricity storage systems from an economic viewpoint are highly dependent on the storage's operation time, the nature of the overall system, availability of other flexibility options, and sector coupling.

Finally, Section 4 discusses about future prospects and application of energy storage, with special focus on grid applications (Section 4.1), demand side management and demand response (Section 4.2) and transportation (Section 4.3).
