Watch the on-demand webinar about different energy storage applications 4. Pumped hydro. Energy storage with pumped hydro systems based on large water reservoirs has been widely implemented over much of the past century to become the most common form of utility-scale storage globally.

As hydrogen plays an important role in various applications to store and transfer energy, in this section, four typical applications of integrating hydrogen into power systems are introduced and demonstrated with example projects: energy storage, power-to-gas system, fuel cell co- and tri-generation and vehicular applications.

Pumped hydro energy storage could be used as daily and seasonal storage to handle power system fluctuations of both renewable and non-renewable energy (Prasad et al., 2013). This is because PHES is fully dispatchable and flexible to seasonal variations, as reported in New Zealand (Kear and Chapman, 2013), for example.
