How much power does a super-capacitor vehicle use?

The Riversimple technology demonstrator fuel cell vehicle uses just 21 kg of super-capacitors, capable of absorbing over 30 kW of power from regenerative braking, and of delivering 15 kW for bursts of acceleration of up to ten seconds. Since 2001, MAN has been developing hybrid super-capacitor buses called the Lion's City Hybrid.

One of the uses of capacitors is short term energy storage. For example single phase AC power goes away ...

From a consumer perspective, one of the greatest choice determinants in any purchase is comparative cost, and in EVs the most expensive component of the vehicle is the battery, or more correctly, the electrical energy storage system as there may be multiple types of energy storage devices in a single vehicle (Berckmans et al., 2017). Clearly this means the ...

The energy in a capacitor is $W = CV^2/2$ and the energy that can be used is $W = C/2(V_{\text{charge}}^2 - V_{\text{discharge}}^2)$
For two strings of four capacitors, the usable energy is $W = 2 * [(10F/4)/2 * ((2.7V^4)^2 - 6V^2)] = 201.6J$
The usable energy in the single string of eight (in series) is $W = 1 * [(10F/8)/2 * ((2.7V^8)^2 - 6V^2)] = 269.1J$
