Among various solar energy technologies, concentrated solar power (CSP) is particularly attractive due to its advantages in terms of high efficiency, low operating cost and good scale-up potential [3], [4]. Solar energy is converted into electricity by means of a CSP plant composed of four main elements: a concentrator, a high temperature solar receiver, a fluid ...

Thermal energy storage (TES) is the most suitable solution found to improve the concentrating solar power (CSP) plant's dispatchability. Molten salts used as sensible heat storage (SHS) are the most widespread TES medium. Concentrated solar power plants (CSP) can operate beyond sunlight hours only when they include energy storage. Thermal energy storage systems which operate at medium (100 °C to 250 °C) to high temperature level (above 250 °C) are preferred in CSP to achieve higher round-trip efficiencies [9].

The main TES technologies include sensible heat thermal energy storage (SHTES), latent heat thermal energy storage (LHTES), and thermochemical energy storage (TCES) [12, 13] pared with SHTES and LHTES, TCES is considered an attractive alternative for next-generation CSP plant design owing to its higher storage density and long-term storage ...
