

Power Station Engineering 4 KP/MECH/PKP THERMAL POWER STATION A thermal power station or a coal fired thermal power plant uses coal as the primary fuel. Heat released from the burning of coal is used to boil the water to make superheated steam for driving the steam turbine.

- Overall cost is much less than that of steam power station of same capacity. - Thermal efficiency of the plant is higher than that of a steam power station.-Requires less operating staff. Disadvantages: - High running charges as the fuel (diesel) used is costly. - Does not work satisfactorily under overload conditions for a long period.
