On a utility scale, compressed air energy storage (CAES) is one of the technologies with the highest economic feasibility which may contribute to creating a flexible energy system with a better utilisation of fluctuating renewable energy sources [11], [12].CAES is a modification of the basic gas turbine (GT) technology, in which low-cost electricity is used for ...

Any CAES system is charged by using electricity to drive air compressors, resulting in compressed air and heat. In DCAES, the heat is extracted by using heat exchangers (HEX) and dissipated (being of low grade and therefore of low value), whereas the pressurized air is stored in a dedicated pressure vessel, herein referred to as the high-pressure (HP) store.

2.1 Fundamental principle. CAES is an energy storage technology based on gas turbine technology, which uses electricity to compress air and stores the high-pressure air in storage reservoir by means of underground salt cavern, underground mine, expired wells, or gas chamber during energy storage period, and releases the compressed air to drive turbine to ...

compressed and stored under pressure in underground caverns using surplus or off-peak power. During times of peak power usage, air is heated (and therefore expands), which drives a turbine to generate power that is then exported to the grid.

1. Introduction. Compressed air energy storage systems (CAES) are one of the mechanical electricity storage technologies that has received special attention over recent years [1].Simply described, the operation of a CAES system is based on converting electricity into compressed air and reversing the compression energy into electricity via an expansion process ...

The widespread diffusion of renewable energy sources calls for the development of high-capacity energy storage systems as the A-CAES (Adiabatic Compressed Air Energy Storage) systems. In this framework, low temperature (100°C-200°C) A-CAES (LT-ACAES) systems can assume a key role, avoiding some critical issues connected to the operation of ...

OverviewTypesCompressors and expandersStorageHistoryProjectsStorage thermodynamicsVehicle applicationsCompressed-air-energy storage (CAES) is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load periods. The first utility-scale CAES project was in the Huntorf power plant in Elsfleth, Germany, and is still operational as of 2024. The Huntorf plant was initially developed as a load balancer for fossil-fuel-generated electricity

In the European Union (EU), where architectural heritage is significant, enhancing the energy performance of historical buildings is of great interest. Constraints such as the lack of space, especially within the historical centers and architectural peculiarities, make the application of technologies for renewable energy production and storage a challenging issue. This study ...
