

This book develops a consistent macroscopic theory of electromagnetism and discusses the relation between circuit theory and field theory. The theory is developed in successive steps from the Lorentz force, the integral form of Maxwell's equations in free space, and suitable macroscopic models of polarized and magnetized matter.

The EMEH transducer, energy conditioning circuit, and energy storage are required to run ATS from ambient energy sources, as shown in Figure 10. However, the drawback of this system is the complexity of the circuit model. Therefore, a vibration-based EMEH system has been proposed to overcome the hurdles in the automatic running of the system.

From the circuit's theoretical viewpoint, energy storage and rate of energy dissipation are assigned to circuit elements as a whole. Power flowing through a terminal pair is expressed as the product of a potential difference  $v$  between the terminals and the current  $i$  in one terminal and out of the other. Thus, the terminal voltage
