What is energy storage performance testing?

Performance testing is a critical component of safe and reliable deployment of energy storage systems on the electric power grid. Specific performance tests can be applied to individual battery cells or to integrated energy storage systems.

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

What is battery capacity testing?

Capacity testing is performed to understand how much charge /energy a battery can store and how efficient it is. In energy storage applications, it is often just as important how much energy a battery can absorb, hence we measure both charge and discharge capacities.

Is energy storage device testing the same as battery testing?

Energy storage device testing is not the same as battery testing. There are, in fact, several devices that are able to convert chemical energy into electrical energy and store that energy, making it available when required.

What is a stored energy test?

The goal of the stored energy test is to calculate how much energy can be supplied discharging, how much energy must be supplied recharging, and how efficient this cycle is. The test procedure applied to the DUT is as follows: Specify charge power  $P_{cha}$  and discharge power  $P_{dis}$  Preconditioning (only performed before testing starts):

Are there standards for integrated battery energy storage systems?

There are standards for photovoltaic system components, wind generation and conventional batteries. However, there are currently no IEEE, UL or IEC standards that yet pertain specifically to this new generation of integrated battery energy storage system products. The framework presented below includes a field commissioning component.
