**Float Voltage:** When fully charged and not under load, the float voltage typically ranges from 3.40V to 3.50V per cell, helping maintain battery health without overcharging. Voltage Chart for LiFePO<sub>4</sub> Batteries. Understanding the state of charge (SoC) in relation to voltage is crucial for effective battery management.

**Resting Voltage of a 12V Lead Acid Battery.** The resting voltage of a 12V lead acid battery refers to the voltage measured when the battery is not under load (i.e., not connected to any circuits or devices). After a period of rest, a fully charged battery should have a resting voltage around 12.6 to 12.8 volts.

fully charged. The state of charge influences a battery's ability to provide energy or ancillary services to the grid at any given time. o Round-trip efficiency, measured as a percentage, is a ratio of the energy charged to the battery to the energy discharged from the battery. It can represent the total DC-DC or AC-AC efficiency of

If the voltage cap of the charger is set high, this may cause voltage fluctuations in the rest of the system, and this is not the best way to limit the battery voltage. I recommend that you charge each cell to 3.45V for 1 to 2
