this combination of screw piles performs thermally when supplying/rejecting heat for a GSHP system operating for a whole year. This work uses a validated numerical model [3, 9] to simulate a grid of evenly distributed screw piles, where Energy Piles (EP) and Thermal Storage Piles (TSP) are positioned interspersed, evenly spaced 0.7 m apart.

The CaO/CaCO_3 energy storage system ($\text{CaCO}_3 \rightleftharpoons \text{CaO} + \text{CO}_2$ $\Delta H = 178 \text{ kJ/mol}$) has a very high application prospect for its low material cost, high energy storage density and high reaction temperature [4] concentrated solar power (CSP) systems, CaCO_3 is decomposed into CaO and CO_2 at the decarbonation stage when absorbing solar energy. ...

The emission of carbon dioxide (CO_2) associated with the consumption of fossil energy contributes to the climate change and global warming [[1], [2], [3]].To promote the utilization of renewable energy can be

expected to reduce the CO₂ emissions by 80 % up to 2050 (compared to 1990) [4]. The increased penetration of the intermittent renewable energy in ...

The hybrid energy storage comprises two or more types of energy storage elements (Batteries, Ultra-Capacitors and Flywheels). In this research work, the optimal combination of these three types is determined to minimize the voltage and frequency fluctuations caused by the connection of pulsed loads on the AC or DC sides of the system.
