The flywheel energy storage system consists of a cylinder or shaft connected to an electric generator. In this energy storage system, electrical energy is converted by the generator into kinetic energy, and this kinetic energy will be discharged and converted to electrical energy using the same motor-generator whenever is needed .

A PV technician using a DMM to measure voltage in a combiner box - the first step in finding a ground fault. Visual Inspection: Damaged components causing a ground fault may be evident through a visual inspection. Taking the time to walk the site and visually inspect the system may provide a technician with a relatively quick identification of the problem.
