The energy consumption in the built environment represents one of the major contributors of carbon emissions to the atmosphere. This leads to the need for a transition in the building sector and the introduction of policies that pursue high efficiency in residential and non-residential buildings with an increasing share of renewables.

An induction furnace is an electric furnace in which ferrous metal scrap and fluxes (e.g. silica, limestone) are melted using an electromagnetic field to produce steel or cast iron. This metallurgical process is accompanied by the generation of large amounts of wastes called slags, which are composed mainly of a non-metallic part as well as a small metallic part.

Regarding energy storage, pumped hydroelectric energy storage (PHES) is the easiest way to supply electric energy storage elsewhere [83]. Unfortunately, PHES has round-trip efficiencies of 70 to 80%, which is much less than the 95% round-trip efficiency of Li-ion batteries, and traditional hydro gravity plants are unavailable in Saudi Arabia ...

Thermal energy storage (TES) is a technology that reserves thermal energy by heating or cooling a storage medium and then uses the stored energy later for electricity generation using a heat engine cycle (Sarbu and Sebarchievici, 2018) can shift the electrical loads, which indicates its ability to operate in demand-side management (Fernandes et al., 2012).

A few days ago, the aludirome heating wires independently researched and developed by Beijing Shougang Gitane New Materials Co., Ltd. were successfully applied to the Zhangjiakou Mountain News Center of the Olympic Winter Games and its surrounding clean heating facilities, marking that Shougang's "Ganghua"-branded high-quality electric heat ...

(Smart & Easy) We can't program the wind to blow when we need it neither we can't programm sunlight. So the key is to store energy for the energy transformation. But, do you...

While the battery is the most widespread technology for storing electricity, thermal energy storage (TES) collects heating and cooling. Energy storage is implemented on both supply and demand sides. Compressed air energy storage, high-temperature TES, and large-size batteries are applied to the supply side.

Hereby, c_p is the specific heat capacity of the molten salt, T_{high} denotes the maximum salt temperature during charging (heat absorption) and T_{low} the temperature after discharging (heat release). The following three subsections describe the state-of-the-art technology and current research of the molten salt technology on a material, component and ...
