Thermal energy storage technologies utilizing phase change materials (PCMs) that melt in the intermediate temperature range, between 100 and 220 °C, have the potential to mitigate the intermittency issues of wind and solar energy. This technology can take thermal or electrical energy from renewable sources and store it in the form of heat.

The cold energy recovery module recovers deep and shallow LNG cold energies using intermediate working mediums. The cold energy storage module acts as a buffer to promote stable cooling output. Key results revealed the maximum stable cooling output of conventional system (without cold energy storage) is constrained by the minimum regasification ...

Pumped hydro storage is the most-deployed energy storage technology around the world, according to the International Energy Agency, accounting for 90% of global energy storage in 2020. 1 As of May 2023, China leads the world in operational pumped-storage capacity with 50 gigawatts (GW), representing 30% of global capacity. 2

Thermal energy storage is also of interest in many industrial processes. In the steel industry, for instance, the energy released by furnaces is often stored for preheating materials such as those undergoing heat treatment. Similarly, process industries often need heated fluids, such as air and water, and thermal energy storage systems are ...
