thermal energy for continuous microgrids.

A microgrid is a self-sufficient energy system that serves a discrete geographic footprint, such as a college campus, hospital complex, business center or neighborhood. A microgrid typically uses one or more distributed energy sources (solar panels, wind turbines, combined heat and power, gas or diesel generators, fuel cells) to produce its power.

Moving forward, microgrids built on solar + storage look set to expand even more rapidly as a part of local, state, and federal climate action plans. The U.S. military already deploys microgrids on military bases throughout the country for strategic purposes, and the Department of Defense is actively implementing renewable-based microgrids on ...
