The two key elements of KEST are superflywheel and powerful electric motor/generator. Our energy storage system survives unlimited number of high-power 100% SOC discharge cycles without degradation or loss in capacity, while being completely eco-friendly and operationally safe.

Power converters for energy storage systems are based on SCR, GTO or IGBT switches. In an early stage of energy-storage development, SCRs were the most mature and least expensive semiconductor suitable for power conversion. However, due to the fact that an energized power line must provide external on/off signals to those

The air-gap eccentricity of motor rotor is a common fault of flywheel energy storage devices. Consequently, this paper takes a high-power energy storage flywheel rotor system as the research object, aiming to thoroughly study the flywheel rotor's dynamic response characteristics when the induction motor rotor has initial static eccentricity.
