The technology of choice today is the pumped-storage power plant. In any excess power supply, water is electrically pumped into a reservoir on a hill, so that it can be discharged when power demand is high to drive a turbine in the valley. Efficiency is between 75 and 85%. Today, Germany has pumped- storage power plants producing

Energy storage is well positioned to help support this need, providing a reliable and flexible form of electricity supply that can underpin the energy transformation of the future. 1 INTRODUCTION 1.1 Literature review. Large-scale access of distributed energy has brought challenges to active distribution networks. Due to the peak-valley mismatch between distributed power and load, as well as the insufficient line capacity of the distribution network, distributed power sources cannot be fully absorbed, and the wind and PV curtailment ...

The power supply arms share a set of energy storage equipment through the back-to-back converter to realize energy penetration. In the combined in-phase power supply system [30, 31], one side of the converter is connected to the high voltage matching transformer, the other side is connected to the traction transformer.

The stored energy can then be used whenever demand exceeds supply. In the absence of Energy Storage, the amount of power generation in a conventional power grid must be drastically scaled up or down (dependent on the occasion) to meet demand, resulting in all of the negative issues associated with the inefficient use of power units.
