

# Energy storage soc and soe

What is the difference between SOC and SOE?

SOC, or State of Charge, is the percentage value that indicates the battery's state during the charge and discharge process as compared to its full-charge state. SOE, or State of Energy, indicates the energy state in the battery. Although they are related, they are not the same.

Can SOC and SOH be used in energy storage applications?

An experimental comparison between SOC and SOH estimation performed by suggested and standard methods is able to confirm the consistency of the proposed approach. To obtain a full exploitation of battery potential in energy storage applications, an accurate modeling of electrochemical batteries is needed.

How is State of Energy (SoE) calculated?

But a more valid way to calculate SoE is by taking the area of the State of Charge (SOC)-Open Circuit Voltage (OCV) Curves, multiply it with the nominal capacity, and then divide the result by the total area of the SOC-OCV curve multiplied by the nominal capacity. With this method, a 5% change in SoE would not be the same as a 5% change in SoC.

What are the critical aspects of energy storage?

In this blog, we will explore these critical aspects of energy storage, shedding light on their significance and how they impact the performance and longevity of batteries and other storage systems. State of Charge (SOC) is a fundamental parameter that measures the energy level of a battery or an energy storage system.

What is a battery SOE?

The battery SOE provides more useful EV driving range information. SOE can be defined as the residual available energy to the maximum available energy (EA) and mathematically expressed as follows: 
$$SOE(t) = \frac{1}{EA} \int_{t_0}^t I dt$$
 where,  $SOE(t_0)$  is the SOE at the time  $t_0$ .

How is a SOE estimated?

The SoE is estimated based on a mathematical relationship between the SoE and the estimated OCV. The methods benefit from a low complexity but may suffer accuracy, especially for dynamic, real operations.

Lithium-ion batteries (LIBs) are widely used in energy storage systems and electric vehicles as a type of energy storage device with a wide operating temperature range, long charge-discharge cycle life, high energy density, and environmentally friendly characteristics during usage. ... State of Charge (SOC) and State of Energy (SOE) are ...

State of energy (SOE) is the ratio of the actual remaining watt-hour capacity of the battery to the rated watt-hour capacity. SOE describes the actual remaining available power of the energy storage system, which is used for energy storage system revenue budget accounting and the formulation of whole container and whole

station dispatching strategies.State of charge ...

Lithium-ion batteries (LIBs), as energy storage and power supply for electric vehicles (EVs), have received more and more attention due to their outstanding performance in high power and energy density and long cycle life. ... [11], SOE was associated with SOC and was calculated directly by using SOC. Filtering or observation algorithms, ...

Accurate estimation of the state-of-energy (SOE) in lithium-ion batteries is critical for optimal energy management and energy optimization in electric vehicles. However, the conventional recursive least squares (RLS) algorithm struggle to track changes in battery model parameters under dynamic conditions. To address this, a multi-timescale estimator is ...

This paper presents a direct experimental evaluation of differences between state-of-charge (SOC) and state-of-energy (SOE) metrics for lithium-ion storage batteries. The SOC-SOE metric differences are first investigated for single constant-current-constant-voltage (CCCV) cycles under room temperature (25°C) conditions to understand the significance of ...

Dealing with the pressure from environmental damage and energy crisis has been one important task for all countries (Akinlabi and Solyali, 2020).Electric vehicles (EVs) have been widely accepted as a clean transportation technology to reduce the reliance on fossil fuels, and play an important role in slowing down global warming rate thanks to the exploitation of the ...

A review of battery energy storage systems and advanced battery management system for different applications: Challenges and recommendations ... remaining useful life (RUL), state of function (SoF), state of performance (SoP), state of energy (SoE), state of safety (SoS), and state of temperature (SoT) as shown in Fig ... SoC and impedances are ...

A combined state of charge (SOC) and state of energy (SOE) estimation using the dual forgetting factor adaptive extended Kalman filter ... Lithium-ion batteries (LIBs) are the clear winner among the other existing energy storage solutions with energy storage technology advancements. However, it is always inevitable to use a battery management ...

Accurate online estimation of the state of charge (SOC) and state of energy (SOE) of lithium-ion batteries are essential for efficient and reliable energy management of new energy electric vehicles (EVs). To improve the accuracy and stability of the joint estimation of SOC and SOE of lithium-ion batteries for EVs, based on a dual-polarization (DP) equivalent ...

A. Key Differences between Battery State SOC, SOH, and SOP. State of Charge (SOC): SOC primarily measures the remaining energy capacity of a battery. It provides information about how much energy is left, expressed as a percentage of the battery's total capacity. SOC tells us whether the battery is full or partially depleted.

Based on the equivalent circuit model of a lithium-ion battery, this paper proposes a sliding mode observer for its State-of-Charge (SoC) estimation. In order to further estimate the State-of-Energy (SoE) of lithium-ion batteries, a real-time SoE estimation algorithm is established using the super-twisting technique. The Lyapunov stability theory is utilized to prove the proposed SoC and ...

To improve the energy storage management system of an electric vehicle, we monitored exact battery states. Here we created different models for BMS management, for thermal modelling, thermal characteristics and EV modelling. We used different drive cycles sources to get our results here, we simulated models for different set of time and got simulation results. The ...

A framework for joint SOC and SOH estimation of lithium-ion battery: Eliminating the dependency on initial states. Author links open overlay panel Xiaoyong ... as the energy storage solution in EVs [1]. A critical component in ensuring the efficiency and safety of LIBs is the battery management system (BMS), tasked with monitoring and ...

Lithium-ion batteries are extensively utilized in electric vehicles and energy storage systems due to their advantageous features, including long cycle life, high energy density, and low self-discharge rate [].SOC and SOH are two important parameters in the battery management system (BMS) [], which provide important references for battery safety protection, ...

With the gradual transformation of energy industries around the world, the trend of industrial reform led by clean energy has become increasingly apparent. As a critical link in the new energy industry chain, lithium-ion (Li-ion) battery energy storage system plays an irreplaceable role. Accurate estimation of Li-ion battery states, especially state of charge (SOC) ...

Currently, the methods of multi-state joint estimation of battery have been mentioned in some review papers. As shown in Table 2, in 2019, Hu et al. [17] systematically describes the research achievements of SOC, SOE, SOH, SOP and other battery single state estimation problems in a tutorial for the first time.[17] also discusses the multi-state joint ...

A new method based on the BPNN is presented for the SOE estimation in this paper. The SOE, instead of the SOC, is introduced to describe the energy state of the battery. In the SOE estimation, the energy loss on the internal resistance, the electrochemical reactions and the decrease of the OCV is considered more comprehensively.

The state of charge (SOC) and state of energy (SOE) of lithium-ion batteries (LIBs) are fundamental parameters in the battery management system (BMS). However, the simultaneous estimation of the two states is challenging since the SOC and SOE are highly affected by the battery's uncertain operating conditions. In this article, a joint SOC and SOE estimation method ...

Energy storage technology is crucial for electric vehicles and microgrids, reducing fossil fuel reliance and promoting renewable energy integration. ... Compared with SOC, SOE is directly related to energy consumption and not only covers the capacity characteristics of lithium-ion batteries but also reflects changes in voltage [9]. SOE can ...

Real-time battery SOX estimation including the state of charge (SOC), state of energy (SOE), and state of health (SOH) is the crucial evaluation indicator to assess the performance of automotive battery management systems (BMSs). Recently, intelligent models in terms of deep learning (DL) have received massive attention in electric vehicle (EV) BMS ...

where ( $E_{\text{rated}}$ ) is the nominal energy. ( $E_{\text{rated}}$ ) is the total output energy of the battery from fully charged state to end of discharge at a specific current rate. ( $E_{\text{remaining}}$ ) is the battery's remaining energy, which is the total energy output of the battery from current state to end of discharge at the specific current rate (Li et al. 2017a, 2021; Zhang ...

As is the case with most electrochemical energy storage systems, ... Third, the SOC-electric quantity method is used to estimate the SOH in real-time based on the updated SOC, and the SOE-SOC curve and the total energy are updated in real-time using the ordinary least squares (OLS) algorithm . Fourth, SOC and SOE-SOC curve is used to estimate ...

Battery: the SoC of a battery shows the amount of energy stored in the device and how much it could be charged or discharged according to the energy generation potential or consumption needs at the site.; Electric vehicle (EV): SoC plays a crucial role in determining the range and performance of the vehicle. Drivers need to monitor the desired state of charge ...
