Lithium-Ion (Li-Ion) batteries are widely used for energy storage applications in microgrids systems. A real time estimation of static and dynamic conditions of the battery pack, such as the remaining capacity or the aging effects, is fundamental for these applications, where it is necessary to ensure stability and reliability in the power supply.

First, using energy storage devices, the output power of the CFPP can be adjusted to meet the changing needs of the power grid load [13]. Second, energy storage devices can improve the peaking capacity and response speed of CFPP, particularly the AGC response rate of the units under low-load conditions [14], [15].
