The need for continued research and development, policy support, and collaboration between energy stakeholders is emphasized to drive further advancements in energy storage.

What makes a good energy storage system?

Types of energy source and final use are the main decision-maker for an energy storage system. Traditionally, the form of energy in source, storage, and demand should be identical for better system performance. However, many practical applications do not allow to create that conditions, especially for renewables.

Lime is the earliest cementing material used by mankind [1]. Calcium hydroxide ($\text{Ca}(\text{OH})_2$), the main component of lime, is widely used in thermochemical energy storage (TES) systems. At a large scale, TES systems are a key component for increasing the reliability, dispatchability, and efficiency of thermal solar power plants, as they allow the power ...
