In the process of human production and life, temperature regulation is necessary to achieve thermal comfort. The principle of common temperature regulation is that water, having a high specific heat ( $4.2 \text{ J g}^{-1} \text{ }^\circ\text{C}^{-1}$ ) stores and releases energy as sensible heat [8], [9], while salt absorbs and releases heat during dissolution and decrystallization [10], [11].

2.1. Energy-Storage Cycle. Much like other energy storage media, a water balloon operates in a cycle to store and supply energy. Figure 1 illustrates the processes of the cycle, in which a balloon is inflated with cold water, heated, deflated when it is warm, and cooled when it is flat. The inflation process deposits energy into the balloon, and the balloon's ...
