Why is heat pump and thermal energy storage important?

Heat pumps and thermal energy storage for heating TES is very important in HP systems since it decreases the thermal capacity to less than the maximum heating requirement and enables a larger share of renewables. It balances system operation and allows an HP to operate at full capacity throughout the year, hence the SPF increases.

How is heat stored in a thermochemical system?

In thermo-chemical storage, the heat is not stored directly as sensible or latent heat but by way of a physicochemical process like adsorption or absorption that consumes heat in charging mode and releases heat in discharging mode. These systems have a high energy density but are complex.

Can a heat pump be used as an ancillary heat source?

Once hot liquid refrigerant has transferred energy to the central heating system, it leaves the condenser with sensible heat which can be utilized. Here we report a modified and flexible Evans-Perkins heat pump cycle integrating heat recovery and storage which is then used as an ancillary heat source for the heat pump's operation.
