By assembling HATN with a $v\text{-MnO}_2$ cathode, we produce a high-capacity proton battery with a reversible specific capacity of 260 mAh g^{-1} at 0.1 A g^{-1} and an excellent energy density up to 118 Wh kg^{-1} . The high performance is found to result from the abundant $\text{C}=\text{N}$ moieties and the p-conjugated structure of HATN, ...

In practice, high-capacity and low-cost electrode materials play an important role in sustaining the progresses in lithium-ion batteries. This review aims at giving an account of recent advances on the emerging high-capacity electrode materials and summarizing key barriers and corresponding strategies for the practical viability of these ...

Temperature: Extreme temperatures can also impact the capacity of a battery. High temperatures can cause the battery to degrade more quickly, reducing its overall capacity. On the other hand, low temperatures can reduce the battery's ability to release energy, leading to decreased capacity.

Moreover, the organic lithium battery assembled with $\text{Li}_7\text{P}_3\text{S}_{11}$ and room-temperature high-safety dendrite-free liquid lithium metal anode Li-BP-DME shows longer cycle life and higher capacity compared with the organic lithium battery using the liquid electrolyte. These results show that this new secondary battery has the advantages of long ...
