In the future, high energy density ceramic capacitors will be placed closer to the core engine electronics to optimize the equivalent circuit resistance.

Do dielectric electrostatic capacitors have a high energy storage density?

Dielectric electrostatic capacitors have emerged as ultrafast charge-discharge sources that have ultrahigh power densities relative to their electrochemical counterparts [1]. However, electrostatic capacitors lag behind in energy storage density (ESD) compared with electrochemical models [1,20].

Metallized film capacitors towards capacitive energy storage at elevated temperatures and electric field extremes call for high-temperature polymer dielectrics with high glass transition temperature (T_g), large bandgap (E_g), and concurrently excellent self-healing ability.
