Electric vehicles can act as a home energy storage device where the batteries can be charged and discharged when necessary, either to the home or back to the grid. Enabling the integration of solar PV, batteries, and EV chargers can create a more efficient, resilient, and flexible power grid that protects homes from foreseeable power outages.

This article focuses on stochastic energy management of a smart home with PEV (plug-in electric vehicle) energy storage and photovoltaic (PV) array. It is motivated by the challenges associated with sustainable energy supplies and the local energy storage opportunity provided by vehicle electrification.

General Motors (GM) is partnering with one of California's main investor-owned utilities (IOUs) to explore the potential of vehicle-to-grid and vehicle-to-home battery integration.

Despite their growing affordability, the cost of batteries remains a significant component of BEV prices. However, the capabilities of these batteries extend beyond merely powering vehicles; they can also play a crucial role in home and grid energy management through Vehicle-to-Home (V2H) and Vehicle-to-Grid (V2G) applications [6], [7]. These technologies ...

The global electric car fleet exceeded 7 million battery electric vehicles and plug-in hybrid electric vehicles in 2019, and will continue to increase in the future, as electrification is an important means of decreasing the greenhouse gas emissions of the transportation sector.
