Consider how much of the stored energy you can actually use. Battery sizes are measured by how much solar electricity they can store, but generally, you shouldn't fully drain a battery, as it can damage it, meaning it'll likely need replacing sooner. Most modern batteries allow you to use 85% and 95% of the energy stored.

Liquids - such as water - or solid material - such as sand or rocks - can store thermal energy. Chemical reactions or changes in materials can also be used to store and release thermal energy. Water tanks in buildings are simple examples of thermal energy storage systems.

Adjustable beds can be pricey, typically ranging from \$1,000 to \$3,000. Naturally, models with more bells and whistles typically cost more. The bed price typically includes free in-home setup. (But if it doesn't, you'll have to assemble and set up the bed yourself -- and that can be a tricky task.)

It also means that if you're using your home battery to avoid buying electricity during peak, expensive hours (such as in a region on TOU rates), you can spend more time pulling from your battery and potentially avoid the high-cost block entirely. Especially if you're charging your battery during the day with solar panels, beefing up capacity ...
