Some of the key advantages of flywheel energy storage are low maintenance, long life (some flywheels are capable of well over 100,000 full depth of discharge cycles and the newest configurations are capable of even more than that, greater than 175,000 full depth of discharge cycles), and negligible environmental impact.

Prime applications that benefit from flywheel energy storage systems include: Data Centers. The power-hungry nature of data centers make them prime candidates for energy-efficient and green power solutions. Reliability, efficiency, cooling issues, space constraints and environmental issues are the prime drivers for implementing flywheel energy ...

For FESS itself, however, the most important milestone was met when NASA investigated this technology for space applications in the 1960s and concluded that it was a promising solution for space missions back in the 1970s (Bitterly, 1998) the beginning, they considered FESS as one of the storage candidates; however, due to practical and ...
