What is shared energy storage?

Shared energy storage is an economic model in which shared energy storage service providers invest in, construct, and operate a storage system with the involvement of diverse agents. The model aims to facilitate collaboration among stakeholders with varying interests.

How does storage sharing work?

Under the storage sharing mode in which users invest in storage equipment individually and share their idle storage capacities within the community, the optimal energy storage size is determined by the genetic algorithm. However, the energy trading process is fixed, which may reduce users' cost savings.

Is a shared energy storage mechanism effective?
