Through the short-term energy storage of accumulators, the smooth electricity production can be achieved. As a result, hydraulic systems were widely applied not only in OBWECs but also in different kinds of WECs, such as Wavebob [45], Duck [46], SEAREV [47], Sharp Eagle Wanshan [48], Wavestar [49], Oyster [50], Pelamis [51] and so on. The ...

With the development of more-electric and all-electric aircraft, onboard energy architectures have undergone a technological transformation. The loads in aircraft electrical systems have become more complex due to increased electrification. For instance, high-power electric drive loads in high-voltage DC networks, such as electro-hydraulic actuators (EHA), electro-mechanical ...

Wave energy is one of the primary sources of marine energy, representing a readily available and inexhaustible form of renewable clean energy. In recent years, wave energy generation has garnered increasing attention from researchers. To study wave energy generation technology, we have constructed a real wave energy generation system and designed wave ...

Pumped-storage hydroelectricity (PSH), or pumped hydroelectric energy storage (PHES), is a type of hydroelectric energy storage used by electric power systems for load balancing. A PSH system stores energy in the form of gravitational potential energy of water, pumped from a lower elevation reservoir to a higher

The integration of renewable energy sources requires the use of highly efficient energy storage technologies. The efficiency of the storage system drops with energy losses. Hydraulic loss which is the energy loss within a moving fluid should be determined. This loss could be caused by frictional effects due to the pipe walls or the fluid viscosity.

Wave energy collected by the power take-off system of a Wave Energy Converter (WEC) is highly fluctuating due to the wave characteristics. Therefore, an energy storage system is generally needed to absorb the energy fluctuation to provide a smooth electrical energy generation. This paper focuses on the design optimization of a Hydraulic Energy Storage and Conversion ...

Considering the hydraulic system, energy efficiency can be increased by reducing throttling losses and energy storage/re-utilization. There are two ways to store the potential/kinetic energies, including electric and hydraulic energy regeneration systems (EERS and HERS) [3, 4]. The EERS usually contains a hydraulic motor, generator, electric motor, ...

One is the "direct-drive" power generation, which mainly utilizes gear systems and flywheels for energy storage, and the other is the hydraulic energy storage. Hydraulic energy storage can dampen the impact of wave impulses, because the hydraulic accumulator has much higher buffering and energy storage capacities [13, 14] than the direct ...

According to the latest update, global investment in the development and utilization of renewable sources of power was 244 b US\$ in 2012 compared to 279 b US\$ in 2011, Weblink1 [3]. Fig. 1 shows the trend of installed capacities of renewable energy for global and top six countries. At the end of 2012, the global installed renewable power capacity reached 480 ...
