

In power system, the moment of inertia is the main index to measure the frequency change rate of power grid. The bidirectional power control of energy storage system improves the frequency modulation capability of power grid, which means that the energy storage system provides additional moment inertia for power grid.

The same mass m can now be distributed in a ring, Fig. 11.2B without changing the velocity of the mass or the energy stored. By knowing the moment of inertia for such a geometry; $I = mr^2$, the energy stored can be expressed as: (11.2) $E = \frac{1}{2} I \omega^2$ Now if the same mass m has the shape of a thin disc of outer radius r , Fig. 11.2C, then the moment of inertia ...

The property of a body to remain at rest or to remain in motion with constant velocity is called inertia. Newton's first law is often called the law of inertia. As we know from experience, some objects have more inertia than others. It is obviously more difficult to change the motion of a large boulder than that of a basketball, for example.

The intermittent and irregular nature of renewable energy sources necessitates at least some form of energy storage if uninterrupted supply is to be achieved [1]. Mismatches in supply and demand need to be accounted for on a wide range of time scales, from the order of weeks or months as a result of diurnal and seasonal variations [2], to seconds and milliseconds.
