Among the many energy storage technology options, thermal energy storage (TES) is very promising as more than 90% of the world's primary energy generation is consumed or wasted as heat. 2 TES entails storing energy as either sensible heat through heating of a suitable material, as latent heat in a phase change material (PCM), or the heat of a reversible ...

A PCM is typically defined as a material that stores energy through a phase change. In this study, they are classified as sensible heat storage, latent heat storage, and thermochemical storage materials based on their heat absorption forms (Fig. 1). Researchers have investigated the energy density and cold-storage efficiency of various PCMs [[1], [2], [3], [4]].

Solar energy is a renewable energy source that can be utilized for different applications in today's world. The effective use of solar energy requires a storage medium that can facilitate the storage of excess energy, and then supply this stored energy when it is needed. An effective method of storing thermal energy from solar is through the use of phase change ...

The article presents different methods of thermal energy storage including sensible heat storage, latent heat storage and thermochemical energy storage, focusing mainly on phase change materials (PCMs) as a form of suitable solution for energy utilisation to fill the gap between demand and supply to improve the energy efficiency of a system.

Phase change temperature and latent heat. The energy storage capacities of the fabricated CPCMs were investigated. Fig. 10 shows the DSC curves of the CPCMs with different ratios of PE extruded at 5 rpm. Two phase change peaks can be seen respectively at 124.91 °C and 185.98 °C, indicating the phase change of HDPE and PE.

Phase change materials (PCMs) are ideal carriers for clean energy conversion and storage due to their high
