The PCM can be charged by running a heat pump cycle in reverse when the EV battery is charged by an external power source. Besides PCM, TCM-based TES can reach a higher energy storage density and achieve longer energy storage duration, which is expected to provide both heating and cooling for EVs [[80], [81], [82], [83]].

1. Introduction. Battery energy storage systems (BESSs) have been deployed to meet the challenges from the variability and intermittency of the power generation from renewable energy sources (RESs) [1-4].Without BESS, the utility grid (UG) operator would have to significantly curtail renewable energy generation to maintain system reliability and stability [5,6].
