

Motor magnetic energy storage

Can superconducting magnetic energy storage cause voltage disturbance in traction power system?

However, the fluctuating characteristics of renewable energy can cause voltage disturbance in the traction power system, but high-speed maglevs have high requirements for power quality. This paper presents a novel scheme of a high-speed maglev power system using superconducting magnetic energy storage (SMES) and distributed renewable energy.

What is superconducting magnetic energy storage (SMES)?

During the braking of a maglev train, the regenerative power from the linear motor will cause high-amplitude overvoltage in the DC bus, which can severely impact the fragile traction power system [20]. Superconducting magnetic energy storage (SMES) is one of the most promising superconducting magnet applications.

Can superconducting magnetic energy storage improve power quality of high-speed maglevs?

Conclusions In this paper, a novel scheme was proposed for high-speed maglevs using superconducting magnetic energy storage and distributed renewable energy sources. The SMES compensation system was used to enhance the power quality of the maglev and ensure stable power supply during operation.

What are energy storage systems?

Energy storage systems (ESS) play an essential role in providing continuous and high-quality power. ESSs store intermittent renewable energy to create reliable micro-grids that run continuously and efficiently distribute electricity by balancing the supply and the load.

Why do electric motors need more energy management strategies?

Since the electric motor functions as the propulsion motor or generator, it is possible to achieve greater flexibility and performance of the system. It needs more advanced energy management strategies to enhance the energy efficiency of the system.

How does a motor-generator reduce energy loss?

And the new generation of motor-generators reduces system energy loss by switching its magnetic reluctance (analogous in a magnetic circuit to electric resistance in an electrical one) to stop energy leaks while idling and to make power input and output more efficient. But the most important technological development is in the bearing, Jawdat says.

ENERGY STORAGE IN A MOTOR . A Thesis by . John E. Doffing . Bachelor of Science, Wichita State University, 2008 (FES) and superconducting magnetic energy storage (SMES). The reference design in this study consists of a combination of these two energy storage methods in the hope of creating a more energy dense storage device. A more ...

Storing an electric motor for more than a few weeks involves several steps to ensure it will operate properly when needed. For practical reason"s, these are governed by the motor"s size and how long it will be out of service. Factors like temperature, humidity and ambient vibration in the storage area also influence the choice of storage methods, some of which may be impractical ...

High-temperature superconducting flywheel energy storage system has many advantages, including high specific power, low maintenance, and high cycle life. However, its self-discharging rate is a little high. Although the bearing friction loss can be reduced by using superconducting magnetic levitation bearings and windage loss can be reduced by placing the flywheel in a ...

As advantages of high energy density and large instantaneous power, flywheel energy storage is very promising energy storage technology in recent years. High-speed permanent magnet synchronous motor (HSPMSM) with low loss and high efficiency is one of the crucial components of flywheel energy storage (FES), and Loss calculation is crucial to ...

This paper presents a novel scheme of a high-speed maglev power system using superconducting magnetic energy storage (SMES) and distributed renewable energy. ... These issues will affect the operation of the linear traction motor of the maglev [18,19]. In addition, during the acceleration of a maglev train, if the load power of the linear ...

The annual growth rate of aircraft passengers is estimated to be 6.5%, and the CO₂ emissions from current large-scale aviation transportation technology will continue to rise dramatically. Both NASA and ACARE have set goals to enhance efficiency and reduce the fuel burn, pollution, and noise levels of commercial aircraft. However, such radical improvements ...

The literature written in Chinese mainly and in English with a small amount is reviewed to obtain the overall status of flywheel energy storage technologies in China. The theoretical exploration of flywheel energy storage (FES) started in the 1980s in China. The experimental FES system and its components, such as the flywheel, motor/generator, bearing, ...

A Permanent Magnet Synchronous Motor (PMSM) was designed and optimized for the designed flywheel in the following section. The motor torque was maximized and torque ripple was minimized as optimization goals. ... A superconducting magnetic energy storage-emulator/battery supported dynamic voltage restorer.
