

Perovskite photovoltaic cell

Are perovskite solar cells the future of photovoltaic technology?

The U.S. Department of Energy Solar Energy Technologies Office (SETO) is a government organization that is investing in the research and development of perovskite solar technologies. They have identified several key areas of improvement if perovskite solar cells are to play a part in the future of photovoltaic technologies.

What is a perovskite photovoltaic device?

Perovskite photovoltaic devices are traditionally fabricated on top of a glass substrate with a thin transparent conducting oxide material.

Can halide perovskites be used in photovoltaics?

The structure information of $\text{CH}_3\text{NH}_3\text{PbX}_3$ ($\text{X} = \text{Cl}, \text{Br}, \text{and I}$) was examined in details, with the unit cell parameters; $a = 5.68 \text{ \AA}$; ($\text{X} = \text{Cl}$), $a = 5.92 \text{ \AA}$; ($\text{X} = \text{Br}$), and $a = 6.27 \text{ \AA}$; ($\text{X} = \text{I}$), respectively. According to a recent study, halide perovskites (ABX_3) shows a promising material for the futuristic applications in photovoltaics . 2.2.

His research interests focus on functional photo-anode and inorganic perovskite for dye-sensitized solar cell and perovskite solar cells. Shengzhong (Frank) Liu received his Ph.D. degree from Northwestern University (Evanston, Illinois, USA) in 1992. Upon his postdoctoral research at Argonne National Laboratory (Argonne, Illinois, USA), he ...

Mixed org.-inorg. halide perovskite solar cells (PSCs) are of interest for space photovoltaic applications due to their apparent tolerance to high-energy proton radiation. Here, the use of a more stable wide-bandgap $\text{FA}_{0.8}\text{Cs}_{0.2}\text{PbI}_{2.4}\text{Br}_{0.6}\text{Cl}_{0.02}$ perovskite with thin encapsulation enables, for the first time, the detailed dependence of fluence and ...

Planar perovskite solar cells (PSCs) can be made in either a regular n-i-p structure or an inverted p-i-n structure (see Fig. 1 for the meaning of n-i-p and p-i-n as regular and inverted architecture), They are made from either organic-inorganic hybrid semiconducting materials or a complete inorganic material typically made of triple cation semiconductors that ...

Chalcogenide perovskite solar cell can work perfectly in a high temperature ($70\text{-}80 \text{ }^\circ\text{C}$) and in humid atmosphere; however, perovskite solar cell cannot survive in high atmospheric temperature and humidity. Perovskite solar cells have less stability issue in high-temperature and aqueous surroundings. The stability is a main issue in the ...

Fabrication versatility is often cited as one of the primary advantages of hybrid halide perovskites as a photovoltaic (PV) material. Indeed, amenability to a wide variety of relatively simple and cheap deposition techniques is one of the reasons so many research groups can contribute to the development of perovskite solar

cells (PSCs).

Adopting a wide-bandgap perovskite absorber in a single-junction solar cell enables the possibility of attaining devices with a larger open-circuit voltage (V_{OC}). Moreover, the wide-bandgap solar cell can be combined with a narrow bandgap solar cell in a multijunction device to realize highly efficient and cost-effective photovoltaic devices.

The perovskite family of solar materials is named for its structural similarity to a mineral called perovskite, which was discovered in 1839 and named after Russian mineralogist L.A. Perovski. The original mineral perovskite, which is calcium titanium oxide (CaTiO_3), has a distinctive crystal configuration. It has a three-part structure, whose ...

The weight of a perovskite solar cell is dominated by the substrate, as the absorber and transport layers are on the nanoscale with negligible weight. Past calculations [24, 25] report that perovskite cell power-to-weight ratios are in the range of 23-29 W/g for 12%-15% efficient cells. These numbers are already superior to all other types of ...

Perovskite light absorbers with the chemical formula APbI_3 (where A is a monovalent cation) have been extensively studied in photovoltaic devices. Among the commonly used A-site cations, such as formamidinium (FA), methylammonium (MA), and cesium (Cs^+), FA has shown promising performance because of its lower bandgap (E_g), improved ...

To overcome these problems, researchers have made great efforts to explore alternative materials for the next-generation photovoltaics. Recently, perovskite solar cells (PSCs) have attracted widespread attention due to the rapidly increasing PCE from 3.8% in 2009 to 26.3% in 2021 [6]. In addition, PSCs also have the prominent advantages of flexibility, low ...

Perovskite vs. Other thin-film solar cell technologies. Perovskite solar cell technology is considered a thin-film photovoltaic technology, since rigid or flexible perovskite solar cells are manufactured with absorber layers of 0.2- 0.4 μm , resulting in even thinner layers than classical thin-film solar cells featuring layers of 0.5-1 μm ...

Perovskites have emerged as promising light harvesters in photovoltaics. The resulting solar cells (i) are thin and lightweight, (ii) can be produced through solution processes, (iii) mainly use low-cost raw materials, and (iv) can be flexible. These features make perovskite solar cells intriguing as space technologies; however, the extra-terrestrial environment can easily cause the ...

In the case of NiO_x based device, HI of 14 % was observed in inverted perovskite solar cell indicating trap density is a more dominating factor than charge accumulation. [11] The defects in the metal oxide ETL exhibit reduced electron conductivity and carrier diffusion coefficient. Thus, to improve the inherent electronic and interfacial ...

Perovskite photovoltaic cell

Although perovskite solar cells (PSCs) offer the potential for low-cost fabrication and high power conversion efficiency (PCE) of 26.1% (1), defects in the perovskite layer have been a major challenge to achieve high PCEs (2, 3), and previous studies have primarily focused on passivating these defects through additives (4-6) or interfacial modifications (7-9).
