Alongside inorganic-based PV cells, organic, hybrid organic-inorganic, and polymeric materials have also been explored and developed in the past twenty years to be employed as active materials in different types of so-called third-generation PV technologies, some of which are about to see actual commercialization. 15-17 Among these, dye ...

Because of an emergent demand for visible-spectrum applications in daily life, organic-based photovoltaics are thought to be a strong candidate to fulfill this need. This article concisely reviews the developments in polymer and small-molecule materials for achieving effective transparent photovoltaic devices and their potential applications in order to engender ...

Polymer Chemistry: A Practical Approach in Chemistry has been designed for both chemists working in and new to the area of polymer synthesis. It contains detailed instructions for preparation of a wide-range of polymers by a wide variety of different techniques, and describes how this synthetic methodology can be applied to the development of ...

The carrier collection efficiency ( $\eta_c$ ) and energy conversion efficiency ( $\eta_e$ ) of polymer photovoltaic cells were improved by blending of the semiconducting polymer with C 60 or its functionalized derivatives. Composite films of poly(2-methoxy-5-(2'-ethyl-hexyloxy)-1,4-phenylene vinylene) (MEH-PPV) and fullerenes exhibit  $\eta_c$  of about 29 percent of electrons per ...

Fig. 1. Schematic of plastic solar cells. PET - polyethylene terephthalate, ITO - indium tin oxide, PEDOT:PSS - poly(3,4-ethylenedioxythiophene), active layer (usually a polymer:fullerene blend), Al - aluminium. An organic solar cell (OSC [1]) or plastic solar cell is a type of photovoltaic that uses organic electronics, a branch of electronics that deals with conductive organic ...

For photovoltaic cells made with pure conjugated polymers, energy conversion efficiencies were typically  $10^{-3}$ – $10^{-2}$ %, too low to be used in practical applications. The recent discovery of photoinduced electron transfer in composites of conducting polymers (as donors) and buckminsterfullerene,  $C_{60}$ , and its derivatives (as acceptors) ...
