For energy storage, electric cars, and portable electronics, layered Li TMO generated from LiMO<sub>2</sub> (M can be Ni, Co, Mn) is mainly used as the cathode. One of the main causes of cycling-induced structural deterioration and the corresponding decline in electrochemical performance is oxygen loss in the layered oxides.

**Sweep Energy Storage System: Pioneering a Circular Economy.** The Sweep Energy Storage System utilizes used batteries from electrified vehicles. This system employs Toyota's proprietary sweep technology, enabling various types of deteriorated batteries to be reused, thus maximizing their remaining energy capacity.

The following energy storage systems are used in all-electric vehicles, PHEVs, and HEVs. Lithium-Ion Batteries. Lithium-ion batteries are currently used in most portable consumer electronics such as cell phones and laptops because of their high energy per unit mass and volume relative to other electrical energy storage systems.

In terms of portable electric components, particularly in EVs, demand for ESDs has increased dramatically with the ESD technology development. Although lead-acid batteries currently have a large market worldwide for the solar energy storage system lithium-ion has been a promising market in the energy storage system. ...
