What is thermal energy storage?

The dominant technology amongst sensible heat energy storage methods is Tank Thermal Energy Storage (TTES) where water is used as a storage medium . Seasonal thermal energy storage in rock mass (Borehole Thermal Energy Storage -- BTES) is another promising technology , .

What are the different types of thermal energy storage?

Based on the storage principle, thermal energy storage can be classified as: (i) sensible heat thermal energy storage (SHTES), (ii) latent heat thermal energy storage (LHTES) and (iii) thermo-chemical energy storage system (TCES).

Energy storage systems are considered a critical solution to answering this intermittency. Latent Heat Storage (LHS) systems have been recognized as promising technologies due to their high energy storage capacity in an isothermal condition at a wide range of temperatures [1], [2]. LHS systems are relied on the effective usage of phase change ...

Liu et al. [28] investigated the cascaded U-tube, shell-and-tube TES system for a CSP-tower plant application by considering three PCMs with melting points ranging from 430 to 550 °C. It was demonstrated that increasing the number of PCM systems in series increases the effectiveness of the extracted sensible energy storage.

However, the shell and tube TES unit gained a competitive edge storing with higher capacity in terms of the mass of PCM and energy storage. Besides, cylindrical, shell, and tube configuration has a profound impact on the heat transfer exchange during melting (Vyshak and Jilani, 2007, Zivkovic and Fujii, 2001).

The paper presents a survey of the experimental and numerical studies of shell-and-tube systems in which phase change material (PCM) is used. Due to the multitude of design solutions for shell-and-tube systems, the emphasis is placed on double-tube (DT), triplex-tube (TT), and multi-tube (MT) units. Additionally, only single-pass systems are considered. ...

The current study concentrated on how the number of fins can affect the PCM melting in a shell-and-tube thermal energy storage system. A PCM of the Rubitherm RT42 type filled the outer tube and sent hot water (340 K) into the inner tube to provide heat. In this regard, the study introduced three cases: one without fins, one with four fins, and ...

Therefore, in this study, the heat transfer process and energy storage performance of a shell-and-tube LTES heated by sinusoidal inlet temperature are investigated. In detail, the effects of different period and amplitude, as well as the Stefan number are analysed based on CFD simulations.

Thermal energy storage (TES) is crucial in the efficient utilization and stable supply of renewable energy. This study aims to enhance the performance of shell-and-tube latent heat thermal energy storage (LHTES) units, particularly addressing the issue of the significant melting dead zones at the bottom, which are responsible for the long charging time.

The physical models of two shell-and-tube LHTES units are shown in Fig. 1. The length of the pipe and cylinder models (L_p / L_c) is 500 mm, and the radii of the inner and outer tubes are 10 mm and 14.14 mm ($R_o = 2 R_i$), respectively. The thickness of the tube walls is neglected, which can satisfy the same volume/mass of PCM and heat transfer area.

The main obstacle of the PCMs which restricts their usage for thermal energy storage (TES) applications is their poor thermal conductivity. Utilizing metal fins is the most popular solution to enhance the performance of PCM-TES. In this work, PCM thermal performance enhancement in a shell and tube heat exchanger (STHX) was numerically ...

Paraffin OP44E was selected as a phase change material, and the water heated or cooled by constant temperature water tanks flowed into the inner square tube as the heat transfer fluid.

1. Introduction. Thermal processes can be improved by using thermal energy storage (TES) systems in several ways. They allow to take advantage of waste heat, to work as a thermal shock absorber protecting the device, or to solve the mismatch between the energy supply and demand, the latter helps to integrate renewable energies [1]. Among the different ...

According to the high storage capacity of latent heat thermal energy storage (LHTES) systems, finding a suitable solution to compensate for the weakness of these systems is logical. The main weakness of these systems is the low thermal conductivity of phase change materials (PCMs) as the storage reservoir of thermal energy. Many methods have been ...
