Will the supply of rare earth elements remain stable?

But some nations, including the US, are increasingly worried about whether the supply of those elements will remain stable. According to the International Energy Agency, demand for rare earth elements is expected to reach three to seven times current levels by 2040; demand for other critical minerals such as lithium may multiply 40-fold.

Are rare earth elements sustainable feedstocks?

Sourcing rare earth elements (REEs) from unconventional feedstocks has substantial environmental and societal-economic benefits. Here the authors develop tools to evaluate the economic viability of unconventional REE feedstocks to facilitate the implementation of a sustainable REE supply.

Is sourcing rare earth elements from unconventional feedstocks economically viable?

Provided by the Springer Nature SharedIt content-sharing initiative Sourcing rare earth elements (REEs) from unconventional feedstocks has substantial environmental and societal-economic benefits, but its economic viability remains unclear. Here we propose a framework for assessing the economic viability of unconventional REE feedstocks.

Are rare earth elements a key component of high-performance permanent magnets?

Rare earth elements are core components of high-performance permanent magnets crucial in the energy transition. Production of rare earth permanent magnets faces numerous challenges and is often subjected to geopolitics. Addressing the rare earth element supply chain challenges must be critical in achieving clean energy targets in 2050.

Why are rare earth metals important?

Rare earth metals (REMs) are indispensable for producing high-performance permanent magnets, key components in many clean energy technologies, such as wind turbines. However, the limited availability and environmental impact of rare earth mining, processing, and purification pose challenges for the green energy transition.

Will rare earths meet demand for permanent magnet production?

However, these projections assume that the supply of critical raw materials, notably rare earths, would meet the demand for permanent magnet production. In a rare earths constraint supply scenario, manufacturers would switch to hybrid designs with fewer rare earths or wind turbine models without REEs components.
