Assuming there are  $T$  charging piles in the charging station, the power of single charging pile is  $p$ , the number of grid charging pile is  $S$ , and the number of storage charging pile is  $R$ . For this reason, the maximum power provided by the grid to the charging station is quantified as  $S$ , which means  $S$  EVs can be charged at the same time.

As the stored energy in the energy pile-soil system builds up, the system temperature increases, leading to a gradual reduction in the daily average rate of energy storage. 2) Compared to dry soil, temperature distribution of partly-saturated and saturated soils shows a more uniform pattern by the end of each charging phase.
