Drastically increasing fleet and consumer use of electric vehicles (EVs) and developing energy storage solutions for renewable energy generation and resilience are key strategies the Biden administration touts to slash national transportation emissions and curtail climate change.

This chapter presents hybrid energy storage systems for electric vehicles. It briefly reviews the different electrochemical energy storage technologies, highlighting their pros and cons. After that, the reason for hybridization appears: one device can be used for delivering high power and another one for having high energy density, thus large autonomy. Different ...

Occasionally, EVs can be equipped with a hybrid energy storage system of battery and ultra- or supercapacitor (Shen et al., 2014, Burke, 2007) which can offer the high energy density for longer driving ranges and the high specific power for instant energy exchange during automotive launch and brake, respectively.

Electric vehicles (EVs) of the modern era are almost on the verge of tipping scale against internal combustion engines (ICE). ICE vehicles are favorable since petrol has a much higher energy density and requires less space for storage. However, the ICE emits carbon dioxide which pollutes the environment and causes global warming. Hence, alternate engine ...
