Storage water heaters store a specific volume of water in an insulated tank. When the hot water tap is turned on, hot water is released from the top of the tank and replaced with cold water, which is then heated for future use. This process ensures that the tank is always full of water that is available for your household needs.

If you're short on time, here's a quick answer to your question: Wall mounted hot water heaters, also known as tankless or on-demand water heaters, provide hot water by rapidly heating cold water as it's needed, eliminating the need for a storage tank. They save space, provide endless hot water, and may save on energy costs versus traditional tank heaters.
