Why do we need 1 MW of gas storage capacity?

The reason: To shut down 1 MW of gas capacity, storage must not only provide 1 MW of power output, but also be capable of sustaining production for as many hours in a row as the gas capacity operates. That means you need many hours of energy storage capacity (megawatt-hours) as well.

What is the difference between rated power capacity and storage duration?

Rated power capacity is the total possible instantaneous discharge capability (in kilowatts [kW] or megawatts [MW]) of the BESS, or the maximum rate of discharge that the BESS can achieve, starting from a fully charged state. Storage duration is the amount of time storage can discharge at its power capacity before depleting its energy capacity.

Energy storage is important because it can be utilized to support the grid's efforts to include additional renewable energy sources []. Additionally, energy storage can improve the efficiency of generation facilities and decrease the need for less efficient generating units that would otherwise only run during peak hours.
