The most common type of supercapacitors is electrical double layer capacitor (EDLC). Other types of supercapacitors are lithium-ion hybrid supercapacitors and pseudo-supercapacitors. The EDLC type is using a dielectric layer on the electrode - electrolyte interphase to storage of the energy. It uses an electrostatic mechanism of energy storage.

A capacitor can store electric energy when disconnected from its charging circuit, so it can be used like a temporary battery, or like other types of rechargeable energy storage system. [73] Capacitors are commonly used in electronic devices to maintain power supply while batteries change. (This prevents loss of information in volatile memory.)

Supercapacitors are the type of capacitors in which energy storage is based on charging and discharging processes at the electrode-electrolyte interface [34]. The energy storage in supercapacitors is governed by the same principle as that of a conventional capacitor, however, are preferably appropriate for quick release and storage of energy [35].

...where: E is the energy stored.; C is the capacitance, which tells us how much charge the capacitor can hold.; and V is the voltage, which is kind of like the pressure of the water in our tank.; An important thing to note: If you double the voltage (increase the pressure), the energy stored goes up by four times. That's a big jump!

A capacitor can store electric energy when disconnected from its charging circuit, so it can be used like a temporary battery, or like other types of rechargeable energy storage system.
