The role of energy storage is to balance supply and demand across energy systems, enabling the storage of excess energy during low demand periods for use during high demand periods. It enhances the reliability and stability of energy systems, facilitates the integration of green energy sources, and improves overall energy management.

TES has low self-discharge losses (0.05-1%), good energy density (80-500 Wh/L), high specific energy (80-250 Wh/kg), and low capital cost (3-60%), although also has low cycle efficiency of 30-60% . According to the range of operating temperatures, TES can be classified into two types: Low-temperature TES and high-temperature TES ...
