Being one of the major energy consumers, cooking is a necessary part of daily life. Non renewable cooking fuel sources, such as wood or cow dung cause hazardous pollution and a poor ecosystem worldwide. Over the past few decades, solar-powered cooking has undergone numerous improvements. Solar cooking has been predominantly used as a ...

A solar cooker is a device that runs on solar energy which is a type of renewable source of energy produced by the Sun. It directly uses the electromagnetic radiation produced by the Sun. These radiations warm up the solar cooker which initially causes it to heat up and is also the main reason for its working.

This work proposes a novel transparent solar cooker design, and its performance is evaluated using a set of experiments. The cooker is fabricated from transparent and non-transparent, and lightweight material. The study was conducted at the Renewable energy laboratory in India (MNNIT Prayagraj). For thermal
