What is the working principle of a transformer?

Figure 1: Transformer. The working principle of transformer is based on mutual induction between two coupled coils. According to this principle a changing flux creates an induced e.m.f in each turn equal to the derivative of the flux so that the total induced e.m.f across N turns is, This can be seen in transformer shown in figure 1.

How does a transformer work?

The piece of equipment that does this, humming with electromagnetic energy as it goes, is called a transformer. Let's take a closer look at how it works! Why do we need a transformer in a power system?
